1. GENERAL INFORMATION

The General Information section explains in general terms the system and the purpose for which it is intended.

1.1 System Overview

The NEM-ALD-W is designed to discover any device connected to an Antenna Line Device (ALD) network. It is compliant with the 3GPP and AISG 2.0 protocols.

Once all devices are discovered and data is collected from the ALD network, the NEM-ALD-W provides different views of the network and allows the user to control the individual devices (RET, MRET, MTS, TMA, RAE).

1.2 Organization of the Manual

The user's manual consists of four sections: General Information, System Summary, Getting Started, and Using NEM-ALD-W.

General Information explains in general terms the system and the purpose for which it is intended.

System Summary provides a general overview of the system. The summary outlines the uses of the system's hardware and software requirements, system's configuration, and system's behavior in case of any contingencies.

Getting Started explains how to acquire the NEM-ALD-W software and install it on a computer. The section briefly presents the system menu.

Using NEM-ALD-W provides a detailed description of the system functions.

2. SYSTEM SUMMARY

This section provides a general overview of the system. The summary outlines the uses of the system's hardware and software requirements, system's configuration, and system's behavior in case of any contingencies.

2.1 System Configuration

The NEM-ALD-W operates on a computer running a Windows® operating system. It is compatible with Windows 7 and higher versions. The application requires a connection to the our USB Protocol Adapter (used as a virtual USB serial COM port). The power can be supplied from the USB Protocol Adapter, or provided from an external source to feed all connected AISG devices (in this case only RS485 A and B lines has to be used). After installation on the computer, the NEM-ALD-W can be used immediately without any further configuration.

2.2 Device Types Supported

The NEM-ALD-W fully supports the following devices compliant with release 6 up to release 13 of the 3GPP standard (TS 25.460, 25.461, 25.462, 25.466) and the AISG 2.0 standard:

- RET (Single Remote Electrical Tilt)
- TMA (Multiple Tower Mounted Amplifier)
- MRET (Multiple Remote Electrical Tilt)
- RAE (Remote eAntenna Extension)

In addition, we offers a Mechanical Tilt Sensor (MTS) which is implemented as a standard pseudo RET. A special interface is included that supports all MTS functionality.

In the case of unsupported devices, they will be detected and assigned to a bus address to avoid any conflict with supported devices on the same network.

Other device types can be fully implemented on customer request. Please contact your representative for further details.

3. GETTING STARTED

This section explains how to acquire the NEM-ALD-W software and install it on a computer. The section briefly presents the system menu.

3.1 PA-USB Installation NEM-ALD-W requires our USB Protocol Adapter.

Before plugging the protocol adapter into the USB port on the PC you need to install the driver first. The driver is available at the following address:

https://www.silabs.com/Support%20Documents/Software/CP210x Windows Drivers.zip

Unzip the driver installation file and launch the installation .exe. Once installed, you can now plug our USB Protocol adapter to your PC. Once detected and installed a virtual serial COM port number will be assigned to the protocol adapter.

This port is now ready to be discovered and used by the NEM-ALD-W.

3.2 NEM-ALD-W Download NEM-ALD-W installation setup is available on request from your contact representative or by email to techsupport@amphenol-antennas.com

The most up-to-date software version can be found and it is recommended to make sure you have the latest version before using it.

3.3 NEM-ALD-W Installation Run the setup installation file.

🔯 Setup - NEM-ALD-W		
	Welcome to the NEM-ALD-W Setup Wizard	I
	This will install NEM-ALD-W version 1.00.0 on your o	computer.
	It is recommended that you close all other application continuing.	ons before

The installation is complete, select if you want to launch NEM-ALD-W now.

Press the Finish button.

3.4 First Execution

On first execution, the NEM-ALD-W will check the product license key and the COM port used.

3.4.1 Product License Key

The NEM-ALD-W is secured against copy and distribution and requires a product license.

Once Product Key License has been received from your contact, enter it 🛛 into the Product Key License dialog box:

Once correctly set **1**, the 'SET License' button is enabled and you can press it **2** and check the result "Valid" **3** and with pop-up window information.

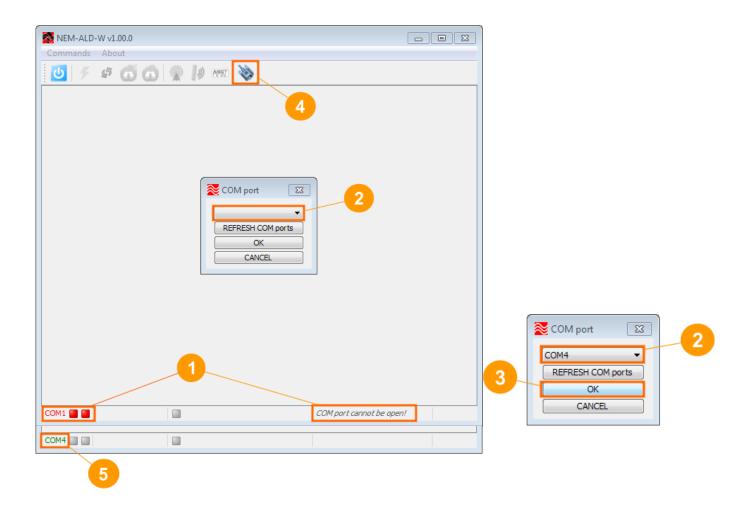

3.4.2 Configure COM Port

On first execution the NEM-ALD-W scans all virtual COM ports that are compatible with our USB Protocol adapter to communicate with the ALD. If only one protocol adapter is connected and correctly installed the user has nothing to configure.

If no COM port can be opened **1** the NEM-ALD-W will provide a drop-down list **2** and ask the user to select the correct one. Once selection is set **3** it will be saved and restored each time the NEM-ALD-W is launched.

The user can select a new COM port ⁽³⁾ at any time. The last COM port selection will always be restored the next time NEM-ALD-W is started.

In the lower left corner of the application the successfully opened COM port is displayed in green⁶.

3.5 Views

Once the ALD network has been discovered, the NEM-ALD-W provides different views and control access to the user from all data collected. These views are selectable by the user and navigation is synchronized between them.

3.5.1 Cell Site View

Cell site view lists all devices and sub-devices in one global table. By default, the table is sorted first by device type, and then by Unique ID. The user can sort the table by clicking any of the column headers.

A double click on any line will display a detailed ALD view with controls for programming and testing.

3.5.3 ALD View

ALD view shows all details and AISG controls of the currently selected ALD. Each ALD type has a specific view:

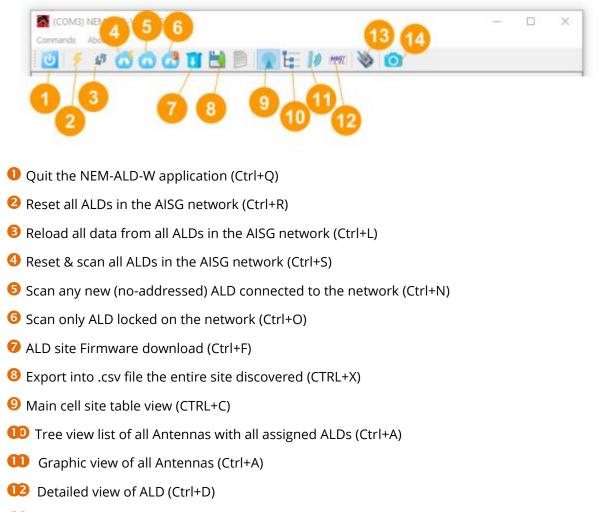

4. USING NEM-ALD-W

This section provides a detailed description of the system functions. It describes the organization of the tool, menus, views, how to discover the ALD network, control devices, configure antennas and organize the cell site.

4.1 Main interface

The main actions that impact the AISG network are accessible from the toolbar or 'Commands' top menu. The current status of the AISG network is displayed to advise the user about the communication status, number of ALDs present, ready and other specific information when applicable.

4.1.1 Tool bar

- COM port selection (CTRL+P)
- III Snapshot of current view

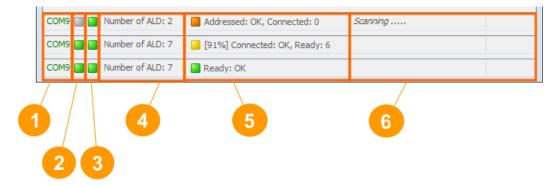

Note: in addition to keyboard shortcut (CTRL+key) available at any time, pressing the 'Alt' key allows underlined key letters to be pressed for keyboard navigation within the menu.

4.1.2 Status Bar

The bottom status bar provides information about the status of the COM port, transmit/receive AISG activity, number of ALDs identified, main status of all ALDs, and other specific information when applicable.

The status bar organization:

1 COM port: port number is **green** when COM port is open, else it is **red**.

2 Transmit line activity.

B

R	eceive line activity.
	no HDLC message
	Addressed HDLC message
	Broadcast HDLC message
	No-address HDLC message
	HDLC message with CRC error

4 Current number of ALDs discovered.

6 Current global status of the AISG network in the following steps:

1 or more ALDs not connected	
All ALDs addressed	
All ALDs connected + current database progress (%)	
All ALDs ready	

6 Specific context message when applicable.

(e.g. "Scanning", "Resetting...", "RET 3 is tilting to 5.0°...")

(e.g. "Scanning", "Resetting...", "RET 3 is tilting to 5.0°...")

4.2 Main window

4.2.1 Scanning

The first operation is to scan the AISG network to discover all ALDs. This operation is launched automatically on NEM-ALD-W start-up if the COM port has already been selected and successfully opened. In addition, it can be requested at any time by the user (for more details please refer to chapter "Tool bar").

ĺ	8 NEM-ALD-W (v1.00.0)	
	Commands About	
	U 🗲 🕫 🗂 💿 👔 🛤 🗞	
4	AISG network is scanning	
	RET 12 MTS 2 TMA 1	
	Abort	
	2	
	3	
	COM9 Number of ALD: 15 Addressed: OK, Connected: 0 Scanning	

While the scan is running:

- **1** ... most operations are disabled
- 2 ... the current total number of ALDs of each device type are live updated
- 6 ... broadcast XID scanning/addressing messages are sent (some collisions are expected)

4 When 'Abort' or 'Reset all' is requested by the user then it stops the scanning operation. The AISG network discovered up to that point is not lost, and the database building operation starts with all ALD found.

4.2.2 Cell Site

Once the scanning operation has been executed or Cell site view has been selected by the user, the list of all discovered devices is displayed:

	Default Order 🔲 ALL			P/N HW SW BTS		
Address	Туре	UID	Port	Antenna	S/N	Status
03	RET	RF0612040709778100R	R	XVF18		9.0°

08	RET	RF0612410705155100Y	Y	XVERRL26 Y	1130126403-005	10.0°
05#1	MRET	RF00000M15010010001	R1	XVBLL20X R	123456789	0.0°
05#2	MRET	RF00000M15010010001	Y1	XVBLL20X Y	123456789	7.8°
05#3	MRET	RF00000M15010010001	Y2	XVBLL20X Y	123456789	2.0°
09	RET	RF06124007059262-R1	RI	XVELL20X R	1340150400-007	3.0°
04	RET	RF0M120905000432-Y2	Y2	XVELL20X Y2	1340150400-007	9.0°
12	RET	RF02080405059172-Y1	Y1	XVELL20X Y1	1340150400-007	5.0°
10	MTS	RFS111000X0019			ABCD	0.1°
11	MTS	RFS111000y0019	G	XV9R20B G	ABCD	2.5°
		3				4

When the user clicks on a column title the table is sorted* according to it:

Address	HDLC address. In case of multi device the subunit index n is added (#n)
Туре	AISG/3GPP device type acronym
UID	Unique ID = concatenation of 2-ASCII vendor code and ALD serial number
Port	AISG port (AISG Antenna Port Color Coding v 2.0)
Antenna	Antenna model (AISG/3GPP additional data 0x01)
S/N	Antenna serial number (AISG/3GPP additional data 0x02)
Status	Current main status of ALD

* The default sorting order is by antenna S/N, then by port number (press the left top button).

2 A double click on any ALD line will open the detailed view for that ALD.

• The antenna column supports color coding Red, Green, Blue and Yellow if supported by device. Else, if "Sector ID" contains these reserved color names 'Red', 'Green', Blue', 'White' or 'Yellow', the color will also be applied.

If an alarm is set then the text is displayed in red or in orange, else the status is green.

4.2.3 AISG Device

The AISG device view is divided into 4 sections:

Í	NEM-ALD-W (v1.48.0) Commands About					
	F Image: Constraint of the second secon		MA: 1			
	RF 0612040709778100R RF 0612420700996100R RF 061251070E0AA10bW RF 061251070C10D10tB RF 0612410705155100Y RF 06124007059262-R1 RF 02080405059172-Y1 RF 0M120905000432-Y2	Vendor Serial number Product HW. version Software Protocol HDLC	Radio Frequency Systems 06124007059262-R1 ACU-A20-N HW04 2.84.0 AISG 2.0 (3GPP v11) Addr. 9 (Rx:74, Tx:74) (Marce Construction of the system of the s	Status Hardware Configured Calibrated Motor Actuator Interference Read	Ready OK OK OK OK OK Clear	3

	COM9 🔄 🚺 Number of ALD: 12	Ready: OK		10°	Calibrate	

• Device type selection: total count of ALDs per device type is indicated. If a button is outlined in red then at least one alarm is activated in the corresponding device type list.

2 List of all ALD serial numbers for the selected device type. If a button is outlined in red then at least one alarm is activated for that device. RETs are regrouped by antenna serial number if information is available.

6 General data and controls for the selected device.

4 Specific data and controls for the device or the subunit of the selected device.

4.2.3.1 General data section

This section is common to every ALD device:

- Device serial number: if RET then "AISG Antenna Port Color Coding v 2.0" is applied.
- **2** General status of ALD: "Ready" means ALD is connected and all data read
- 6 List of applicable alarm codes for device type and status for each alarm
- 4 Reload all ALD data
- 6 ALD hardware reset (AISG/3GPP command 'XID Reset')
- 6 ALD software reset (AISG/3GPP command 'ResetSoftware' 0x03)
- Clear all device alarms (AISG/3GPP command 'ClearActiveAlarms' 0x06)
- 8 Read current alarm status on user request (status is maintained by Alarm Indication)
- 8 Read/Write User Data
- ALD self-test (AISG/3GPP command 'SelfTest' 0x0A)
- **11** Enable/Disable polling RR-frame
- 12 ALD software update

4.2.3.1.1 ALD Software update

The ALD software can be updated when the user clicks on the "SW update" button from the general data section.

The software section is organized by vendor and the NEM-ALD-W supports the XML file distribution format specified by AISG group. In the installation folder there is a folder "Embedded Software Files". It contains at least our folder designed by the AISG vendor code "RF". All latest software versions of all ALD must be placed in this folder.

The "Software" button shows different icons:

Software Latest known software is loaded (when .XML file exists only)

A Software A more recent software is available (when .XML file exists only)

Software. .XML file is missing for this device type

Software No device and no .XML file exists

If additional vendor .XML files exist, create a dedicated folder in addition to "RF" with the 2-character ASCII AISG vendor code. Place .XML files into this folder and restart the NEM-ALD-W.

Additional folders named by AISG device type acronym ("RET", "MRET", "TMA"...) can be added into the vendor folder. Only the .xml or .bin extensions are supported.

When the "Software" button is pressed the NEM-ALD-W behaves in different way:

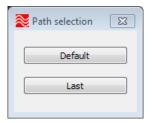

A Software By default the latest known software in the XML file will be loaded

Software Are you sure?

Software Select folder

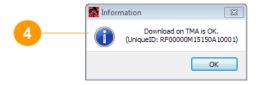

Software Select folder

The first time the NEM-ALD-W selects the default installation folder. If you can select another path, it will be stored for the next time, even after the NEM-ALD-W has been restarted.

- AISG/3GPP command 'Download End' 0x42 to abort ongoing download.
- **2** Downloading progress indicating number of I-Frame buffered.
- 6 AISG/3GPP command 'XID Reset' (will abort also the download)
- 4 Result of downloading

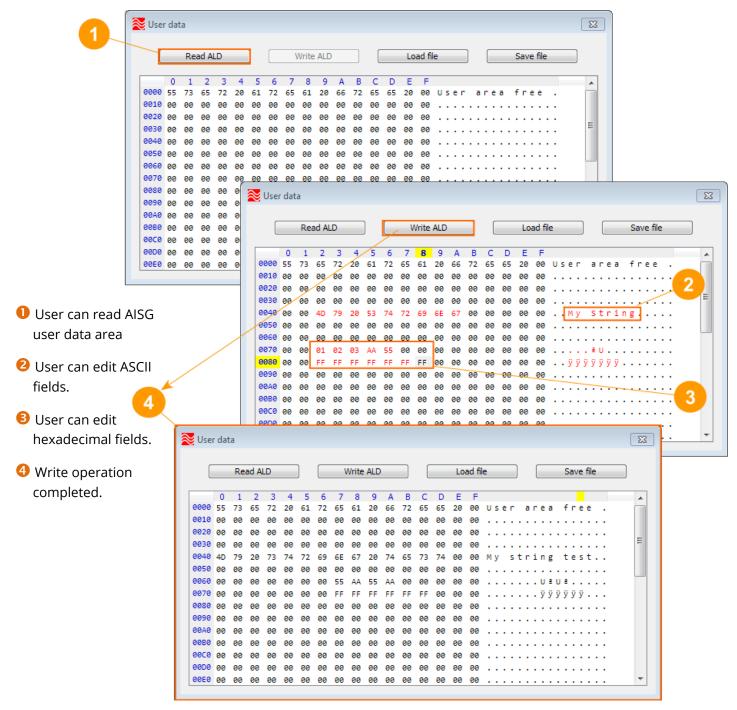

Note: some of our devices can support fast download using vendor specific commands at 115200 baud.

Note: our ACU-X20 product, which is Dual-primary capable, allow to download more than the FW file: it can download a sharing SHA file (see chapter 4.2.6 Sharing mode) and it can download a CFG file to configure the ACU-X20 product for a specific antenna model (in case we replace a defective ACU-X20 product we can replace it by any new product and download CFG file to configure it to the antenna model used).

4.2.3.1.2 User Data

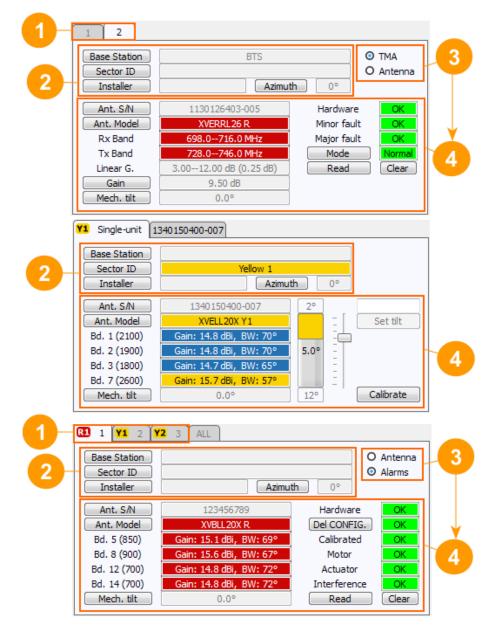

Note: user data size is vendor specific, our devices support a 512-byte area reserved for User Data.

4.2.3.2 Specific Data Section

This section provides access to the details of each subunit with specific device controls, alarms and data. If the device has no sub-unit level (RET, MTS) then general alarms are also unit alarms.

- **1** If the ALD has subunits, tabs are available to switch between each subunit's details.
- **2** Operator data settings (AISG/3GPP additional data 0x21 to 0x25).
- **I**f applicable provides dynamic **4** part content.
- Oevice-specific details. Always includes Antenna Model and Antenna SN assigned to the subunit.

4.2.3.2.1 Operator Data Section

This section allows the user to read/write AISG/3GPP operator additional data 0x21 to 0x25.

AISG/3GPP operator data 0x23: Base Station ID (32-ASCII).

- 2 AISG/3GPP operator data 0x24: Sector ID (32-ASCII).
- AISG/3GPP operator data 0x21: Installation Date (6-ASCII) AISG/3GPP operator data 0x22: Installer's ID (5-ASCII)
- 4 AISG/3GPP operator data 0x25: Antenna Bearing (0 to 359.9°)

4.2.3.2.2 Antenna Data Section

- Select Antenna view for MTS or TMA device (RET has this view only)
- Antenna characteristics (AISG/3GPP additional data 0x03 to 0x05, 0x08*, 0x09*)
- 6 Edit antenna characteristics (press any "Band x" button)
- ④ If our antenna is connected it is easier to select antenna configuration file .ACU.
- **6** When editing, read values can be restored by pressing the "COPY" button.
- **6** While editing, new valid settings are marked green and invalid settings are marked red.
- 🤣 When all settings are OK, button is enabled and pressing it will apply the values.

* 3GPP extended bits supported by AISG/3GPP additional bit bands by data 0x08, 0x09 and 0x0A can be edited according to the negotiated 3GPP version between the NEM-ALD-W and the ALD (max supported release by 3GPP is 3GPP release 13).

Note: negotiated 3GPP release is indicated between parentheses (in this example 3GPP v7).

ISG/3GPP RET data 0x02: Antenna serial number (17-ASCII).

2 User selects antenna configuration file. When "Open" button is pressed ⁽³⁾ NEM-ALD-W configures device with the AISG/3GPP command SendConfigurationData 0x32.
Note: for us this command sets several antenna informative data: AISG/2GPP PET data 0x01 Antenna model. 0x02 operating hands.

Note: for us this command sets several antenna informative data: AISG/3GPP RET data 0x01 Antenna model, 0x03 operating bands, 0x04 beamwidths, 0x05 gains, 0x07 tilt min. and 0x08 tilt max.

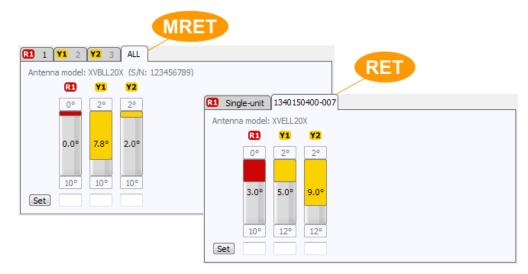

4 AISG/3GPP operator data 0x26: Installed mechanical tilt (-179.9 to 180°)

4 Action is running. Please note that all device control buttons are disabled while the command is running.

The MRET also provides an additional antenna view of all subunits. We can also have several RETs regrouped to one common antenna. If one or more RETs have the same antenna S/N set, then an additional tab is also added to view them associated to this antenna (same as MRET view).

The antenna S/N shall be set correctly and antenna model displayed is the common ASCII string part read from each RET. User can set a new tilt set plan to be applied at this antenna.

4.2.3.2.4 MTS Data Section

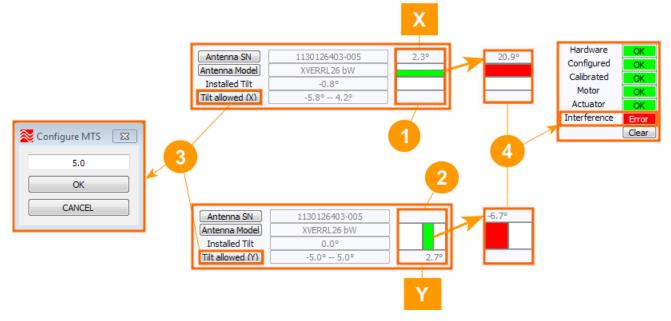

RF 5112300X0001
KF 311230010001
RF 5112300X0002
RF S112300Y0002
(RF 5112300X0003
RF S112300X0004
RF S130600X1100
(RF S130600Y1100

Mechanical Tilt Sensor (MTS) device exists in two versions: one with X-axis and another one with both X-axis and Y-axis.

All MTS are listed and X/Y are associated to identify MTS unit.

X-axis and Y-axis are live displayed with a graphical interface.

The installed tilt is the current tilt when tilt offset is configured. Tilt range allowed is this installed tilt +/- the tilt offset. The alarm 'Interference' 0x26 is set/cleared according to tilt allowed.

Current mechanical X tilt.

Ourrent mechanical Y tilt.

The reference, placed at the middle of the bar graph, is the installed tilt value. While the current tilt is within the allowed tilt range the bar graph is green. When it is outside the allowed tilt range the bar graph is red.

Set the offset for allowed tilt range: more or less than the current tilt. *Note: this operation also updates the installed tilt to the same current tilt.*

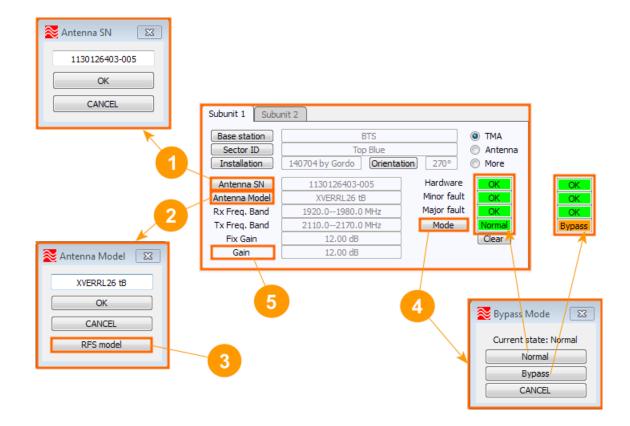

4 AISG/3GPP alarm "Interference" 0x26 is generated when current tilt is outside the allowed tilt range.

USER'S MANUAL

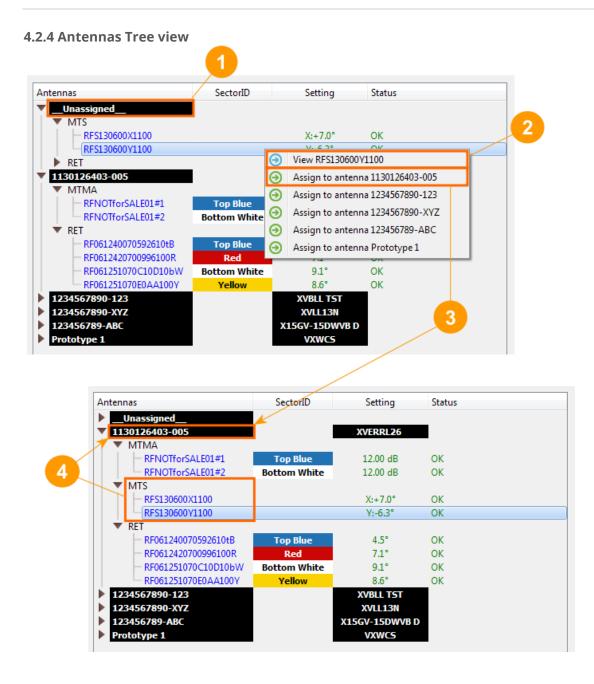

Network Element Manager Software: NEM-ALD-W

4.2.3.2.5 TMA Data Section

- AISG/3GPP RET data 0x02: Antenna serial number (17-ASCII).
- 2 AISG/3GPP RET data 0x01: Antenna model (15-ASCII).
- In case where a TMA subunit is connected to our antenna, the user can select an antenna configuration file .ACU to get antenna model and other antenna characteristics (3GPP bands, beamwidths and gains)
- 4 AISG/3GPP command SetMode 0x71: Normal or Bypass.
- **6** AISG/3GPP command SetGain 0x72. This command is not available for TMAs with fixed gain.

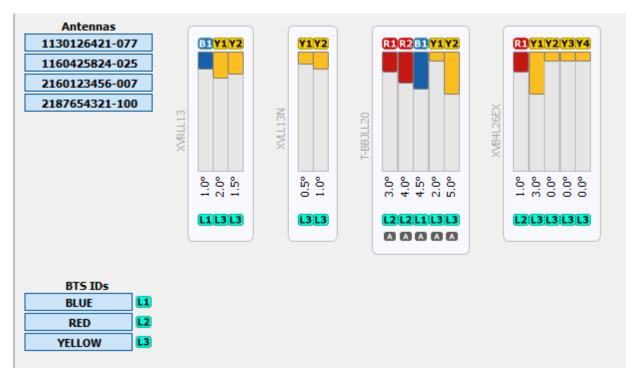

- In All devices which have not been programmed with an antenna serial number are grouped as one unique antenna, under the label "__Unassigned__".
- 2 By clicking the context menu, the user can display the **ALD view** for more. In the ALD view, an antenna can be assigned to any device in the AISG network by programming the ALD's antenna serial number property.
- By clicking the context menu, the user can directly select the antenna serial number from an ALD that has already been configured.
- ⁽⁴⁾ In the example the MTS-XY-A20 with the UniqueID "RFS130300X1100" has been assigned to the antenna model APVERRL26 with the serial number "1130126403-005".

USER'S MANUAL

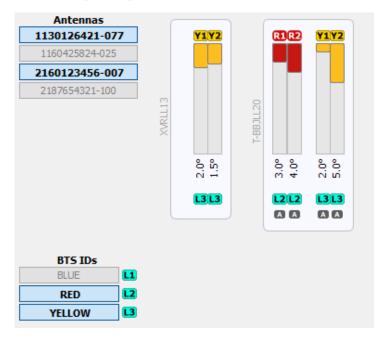

Network Element Manager Software: NEM-ALD-W

4.2.5 Antennas Graphic View

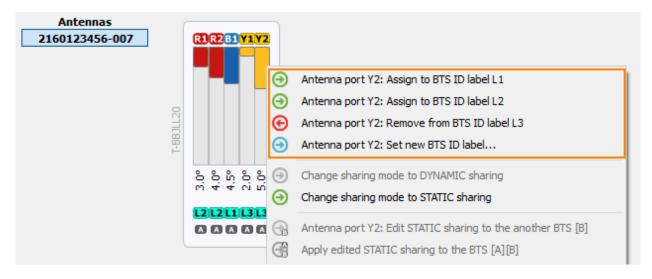

This view shows antennas built from RET units having same antenna S/N; it could be external daisy chained RET, subunits of MRET or virtual RET units.

It can be possible to filter antennas from antenna serial number list but also to filter arrays from BTS IDs identified by "Lx" cyan icons as shown below:

User can access by right-click mouse context menu from each array to specific menu to edit the BTS ID labels: assign, remove or add it.

In addition, in specific case where the Dual-Primary mode is supported by the product (e.g. ACU-X20) we can also edit the way we want to share the arrays between BTS Port A and BTS Port B. Refer to the next chapter for more details on the way the sharing mode can be used.

4.2.6 Sharing Mode

Our Product ACU-X20 is Dual-Primary capable. This product offers two sharing mode: Static or Dynamic.

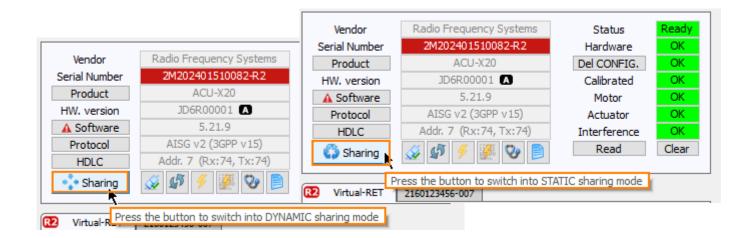

In case of Static Sharing arrays are split between BTS Port A and B in a fixed way, i.e. an array can be discovered, scanned, addressed, controlled only from the BTS Port assigned to this array. One array will never be seen by both BTS Ports.

When arrays use Dynamic Sharing mode the primaries decide where each array will be assigned. It is not under the control of the ACU-X20 product but by primaries. First BTS HDLC address assignment received becomes the master.

The dynamic implementation is simple: on Reset all arrays controlled by virtual Single-RET are in 'no-address' state and all 'no-address' can be discovered (i.e. seen by AISG standard XID scanning process). Once an address is set by a primary it becomes the master of this array and become hidden for the other BTS port. In other words, the first address assignment sets this BTS Port to this array while device is addressable, i.e. until any next reset ('no-address' state).

This Dynamic Sharing mode requires some synchronization between both primaries. Typically, one primary should start, browse, and discover all arrays. Next step from this primary is to deallocate arrays it does not want to use (i.e. reset some to 'no-address) and record UIDs it wants to use. Now the second primary can be started and deallocated arrays (with no-address) will be discovered and useable by this second primary. For next BTS starts, it may be more efficient for each primary to readdress recorded UID instead restart this process.

The NEM-ALD-W offers a direct access to assign DYNAMIC or STATIC sharing from a single button. Note that STATIC sharing activated from DYNAMIC sharing will fix the current dynamic configuration used.

Note: "HW. Version" field shows the current BTS Port A or B with black icon \Lambda or 🖪

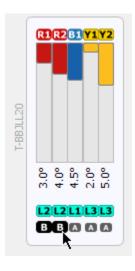

The sharing mode can be edited also from the "Antennas Graphic view". User can access to STATIC and DYNAMIC mode control from the mouse right-click context menu this way:

Antennas	
2160123456-007	R1R2B1Y1Y2
	Antenna port Y2: Assign to BTS ID label L1
	Antenna port Y2: Assign to BTS ID label L2
	Antenna port Y2: Remove from BTS ID label L3
	Antenna port Y2: Set new BTS ID label
	မိုင်းနိုင်ခြင် ကြားရောက် ကျော်ကျောက်ချောက် ကျောက်ချောက် ကျောက်ချောက် ကျောက်ချောက် ကျောက်ချောက် ကျောက်ချောက် ကျ
	Change sharing mode to STATIC sharing
	🗛 🗛 🗛 🕻 🕞 Antenna port Y2: Edit STATIC sharing to the another BTS [B]
	Apply edited STATIC sharing to the BTS [A][B]
BTS IDs	Reset all STATIC sharing to the BTS [A]
BLUE L1	
RED L2	Reset all STATIC sharing to the BTS [B]
YELLOW L3	Export BTS ports STATIC sharing generic file
	Export BTS ports STATIC sharing UID file

Example: when the current sharing mode is DYNAMIC.

In STATIC mode we can edit the current sharing by mouse click on black icons **A** or **B** at the bottom. Once editing is ready, from the mouse right-click context menu on any array select "Apply edited STATIC sharing to the BTS[A][B]":

() () () () () () () () () () () () () (Antenna port Y2: Assign to BTS ID label L1 Antenna port Y2: Assign to BTS ID label L2 Antenna port Y2: Remove from BTS ID label L3 Antenna port Y2: Set new BTS ID label
 ● ● 	Change sharing mode to DYNAMIC sharing Change sharing mode to STATIC sharing Antenna port Y2: Edit STATIC sharing to the another BTS [B]
G3	Apply edited STATIC sharing to the BTS [A][B]
€ € ⊙	Reset all STATIC sharing to the BTS [A] Reset all STATIC sharing to the BTS [B] Export BTS ports STATIC sharing generic file Export BTS ports STATIC sharing UID file

Note: direct access to reset all units to the same BTS are available.

The DYNAMIC mode behavior on the field can be simulated if we connect two NEM-ALD-W, one on each ACU-X20 BTS port. In the example bellow COM3 is connected to BTS Port A and COM4 is connected to BTS Port B of the ACU-X20 product.

1) Connect NEM-ALD-W on BTS Port A and scan for all:

Result is:

Default Or	der		ALL	3GPP	P/N	HW SW	BTS Sector	Vendor	
Address	Ту	pe	Range	UID	Port	Ant. Model	Antenna S/N		
01	R	T	2°12°	RF1M202401510082-R1	RI	T-BBJLL20 R1	2160123456-007	3.0°	
02	R	T	2°12°	RF2M202401510082-R2	R2	T-BBJLL20 R2	2160123456-007	4.0°	
03	R	T	2°12°	RF3M202401510082-B1	61	T-BBJLL20 B1	2160123456-007	4.5°	
04	R	T	2°12°	RF4M202401510082-Y1	¥1	T-BBJLL20 Y1	2160123456-007	2.0°	
05	🔒 RE	т	2°12°	RF5M202401510082-Y2	¥2	T-BBJLL20 Y2	2160123456-007	5.0°	
	Comm		1.0015		2.42.0)	🖹 🗾 🖉 E	- 10 MIST 📎	 0 () ()	0

2) Unlock Y1 and Y2:

Address		Туре	Range	UID	Port	Ant. Model	Antenna S/N	Status
01	9	RET	2°12°	RF1M202401510082-R1	R1	T-BBJLL20 R1	2160123456-007	3.0°
02	9	RET	2°12°	RF2M202401510082-R2	R2	T-BBJLL20 R2	2160123456-007	4.0°
03	9	RET	2°12°	RF3M202401510082-B1	B1	T-BBJLL20 B1	2160123456-007	4.5°
04	6	RET	2°12°	RF4M202401510082-Y1	Y1	T-BBJLL20 Y1	2160123456-007	2.0°
05	1	RET	2°12°	RF5M202401510082-Y2	Y2	T-BBJLL20 Y2	2160123456-007	5.0°

3) Rescan for only locked units:

Result: now only R1, R2 and B2 are assigned to NEM-ALD-W connected to Port A:

) NE	EM-AL	D-W (R&	2D) (DBG) (v2.42.0)			_	
ommands	То	ols A	About					
🗲 ا 🕒	1	¢ (d	🛃 🚺 🛃 📄	2	📡 🗄 🖉 🛤	न्म 🗞 🔆 💧	
Default O	rder	r 🗆	ALL	G 3GPP	P/N	Пнw Пsw	BTS Sector	Vendor
Address			Range	UID	Port	Ant. Model	Antenna S/N	
Address 01	9		Range 2°12°	UID RF1M202401510082-R1				Status 3.0°
	9	Туре	_		Port	Ant. Model	Antenna S/N	Status

4) Now we can scan from NEM-ALD-W to Port B:

Commands	Tools	About
U 🗲	ø	
Default O	rder	AL Scan for all

Result: now NEM-ALD-W to Port B discover Y1 and Y2

ommands Te	ools /	About

		2°12°	RF4M202401510082-Y1	Y1	T-BBJLL20 Y1	2160123456-007	2.0°
01 🔒	RET			Y2	T-BBJLL20 Y2	2160123456-007	5.0°

4.2.6.1 Export sharing file

We can export sharing file to allow new sharing configuration by simply downloading it the same standard AISG way we download for an FW. (see chapter **4.2.3.1.1 ALD Software update**)

Any configured Static or Dynamic Sharing exported SHA file once downloaded will applied the embedded sharing configuration once device is reset. (an auto reset is executed at the end of the download process)

According to the current sharing mode applied from the "Antennas Graphic view the mouse right-click context menu give access to this export function.

- Export BTS ports DYNAMIC sharing generic file...
- Export BTS ports DYNAMIC sharing UID file...

Or

- Export BTS ports STATIC sharing generic file...
- Export BTS ports STATIC sharing UID file...

Note a unique generic dynamic sharing .SHA file will activate any antenna model into DYNAMIC mode, but a generic shatic sharing .SHA file can only activate one antenna model into STATIC mode as many configurations exist. (AABBAA or AAAABBBB or ...)

About us

Amphenol has **acquired** the global Base Station Antenna business since May 15th 2023. We welcome all existing RFS base station antenna customers to Amphenol Antenna Solutions and ensure that we will honour existing agreements in regards to deliveries and product availability.

Amphenol Antenna Solutions is a premium **antenna solution provider** dedicated to the single objective of designing and manufacturing high performance antennas.

We are customer-centric antenna company that **partner** with our customers to develop **innovative and tailored** solutions, that secures optimal coverage and capacity under all circumstances. We are **independent** from any RAN vendor, but work with them all including vRAN vendors to create customized antenna solutions – this gives us a unique position in the preparation for Open RAN future.

With manufacturing and R&D team in Europe, Asia and America we offer local support to our customer – **Across the world. Around the corner.**

Europe Middle East Africa – Asia Pacific Technical support
